

THE BRIGHT KNIGHT RISES

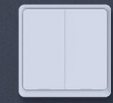

We all know that smart lighting is usually the first step in making a home intelligent, and the market is full of devices that provide intelligent lighting. But, let's be honest, some of them just cause headaches because they are either very complicated to work with or they come with very high price tags because of their multifunctionality. So, what should we do if we just want a simple single-task device that also happens to be smart?

When we say TIS Technology has something for everyone, we mean literally every need and every budget. The 1/2 Gang Dione Switch is such a device! It is a Zigbee-powered wall switch that gives your old light switches a bit of brain!

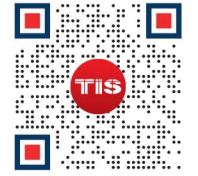

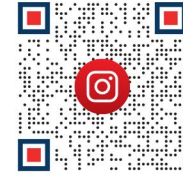

These switches come in one and two-gang combinations, so you can replace your old light switches and gain remote control over your home lights while also maintaining manual navigation. Thus, if your child needs to keep the little monsters away at night, you can help them by leaving the lights on for a while and then turning them off using your smartphone.

You can also make use of Dione Switches' voice control capability for smoother lights' navigation. Ask Alexa or Google Assistant to brighten the living room for your evening reading or to dim the lights for a sweet nap on your comfortable sofa.

It is worth mentioning that the Dion Switches are applicable in various spaces. You can make lighting smart across your kitchen, living room, bedroom, and office or use it in businesses such as hospitals, shops, etc. with just a quick setup period. All you need to do is find a location and mount the device, and you're good to go!
